

ICE EFFECT

The so called ICE EFFECT can be achieved using Kombihel patina and HIDROHEL lacquer. This effect gives the space or element a special and unique appearance. The trendiest colour shade is metallic grey.

1.

Lacquer the wooden surface with Heliodur base enamel. Usually, air spraying is done in two layers.

.....
We recommend inter-layer sanding, top coat sanding is not needed.

2.

When the base enamel is completely dry, HIDROHEL lacquer ICE Effect is applied. After 20 minutes of drying, the iced surface effect starts appearing.

.....

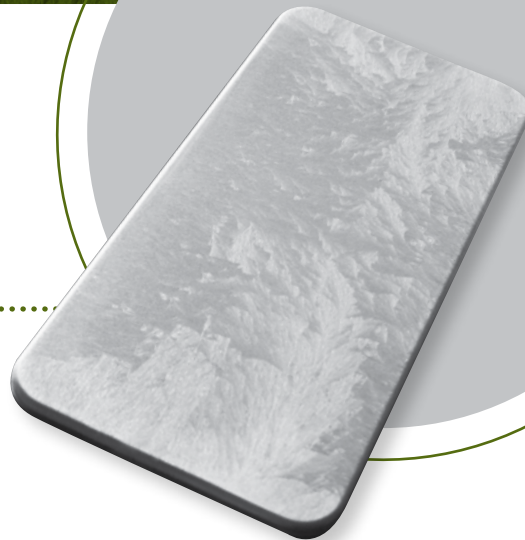

3.

After 24 hours continue with the application of Kombihel CHROME patina, which colours the iced surface in metallic grey.

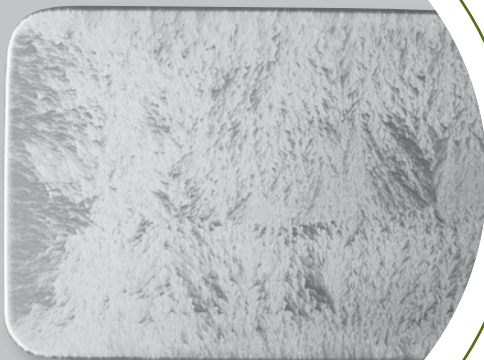

You can choose among different colour shades of Kombihel patinas or stains, depending on the desired end result.

4.

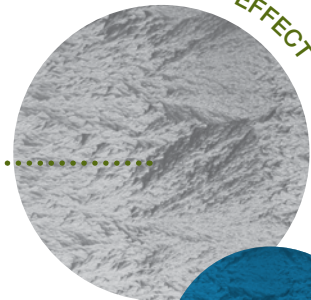

When the previous layer is dry, we finish with transparent lacquer in the selected gloss level.

5.

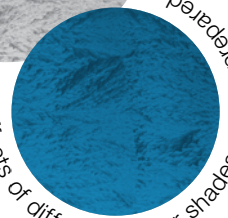

This is the finished product in grey colour. The effect can be created in various shades, depending on the selected material and your wishes.

ICE EFFECT

Effects of different colour shades can be prepared.
